SecureRouter X200: Security Assessment Summary

Prepared by: Independent Test Lab (fictional, for evaluation purposes) | Version 1.2 | October 2026

1. Product overview

The SecureRouter X200 is a small business router priced at $149. It supports WPA3, a built-in VPN, guest network isolation and automatic firmware updates.

2. Test results

- WPA3 encryption: Pass. Correctly configured by default.
- Guest network isolation: Pass. Guest clients could not reach the internal LAN.
- Automatic firmware updates: Pass. Updates are signed and verified before install.
- Admin web interface: FAIL. The default admin password (admin/admin) is not forced to change on first login, and the admin page is reachable from the WAN (internet) side by default. Advisory SR-2026-014. Severity: High. No fix is available yet; the vendor expects one in Q1 2027.

3. Recommendation

Suitable for small offices only if the admin password is changed immediately and remote (WAN) administration is disabled manually until the vendor releases a fix for SR-2026-014.
